

# The offshore transition to renewables

Plural offshore wind technology insights

April 2021

# Agenda

## **Plural expertise**

Offshore wind

- Summary

- Global capacity

- Supply chain

- North America case

- Upside scenarios and market risk

Appendix

# We have extensive expertise across offshore technology applications

Our focus – offshore:

**Mechanical and digitally-enabled technologies, and value-added services**

## Wind

- Development and installation
- Production facilities
- Subsea / transmission
- O&M

## Oil and gas

- Exploration
- Production facilities
- Subsea
- O&M

## Marine

- Oceanic shipping
- Offshore support vessels
- LNG
- Commercial brownwater
- Fishing

# Agenda

Plural expertise

Offshore wind

## **Summary**

Global capacity

Supply chain

North America case

Upside scenarios and market risk

Appendix

# Wind is an increasingly attractive offshore segment for energy corporations, technology manufacturers and investors

## Summary

- Global capacity in offshore wind is increasing globally. This is being driven by:
  - Increasing cost competitiveness with other forms of clean power generation
  - Practical benefits of offshore wind (e.g. negligible land usage and constant power generation)
  - Energy companies' desire to diversify
- The offshore wind sector is fundamentally changing, moving further from the shore and into deeper waters. This will have implications for supply chain spending:
  - Foundations will become bigger and more expensive
  - There will be increased amounts of larger transmission equipment installed
  - Digital technology uptake will be accelerated

# Globally, offshore O&G CAPEX has declined sharply; offshore wind is in early stage growth with a strong outlook

Upstream O&G and offshore wind, CAPEX \$bn

# The most promising technology segments are transmission, transmission installation and foundations driven by a shift towards deeper water farms

European expenditure across all offshore wind supply chain activities, Euro bn

Source: BVG Associates, Plural analysis

© Plural Strategy Group 2021

# Emerging digitally-enabled tech segments are being driven by wind farms moving further from the shore and into deeper waters

Key technology trends in offshore wind

Technology	Expected outlook 2020-30	Comment
Digital monitoring equipment		<ul style="list-style-type: none"><li>• With the shift to windfarms being further out to sea and sitting in deeper waters, it is becoming more cost efficient to monitor wind farms using digital technology, rather than paying for expensive surveys to be carried out</li><li>• The development of floating wind farms and the subsequent accelerated shift of wind farms to be further away from the shore will help to drive uptake in these technologies</li></ul>
Autonomous vehicles / Drones		<ul style="list-style-type: none"><li>• This shift is also increasing the uptake of autonomous vehicles and drones</li><li>• Instead of using divers in deeper water, an autonomous vehicle can carry out the inspection more safely and efficiently</li><li>• Drones can be quickly deployed to inspect turbines that may have suffered damage</li></ul>
Predictive analytics		<ul style="list-style-type: none"><li>• Using increasing levels of data from sensors and other monitoring equipment, O&amp;M costs can be driven down by using predictive analytics for fault prediction</li><li>• This reduces downtime of the turbine and need for costly inspections</li><li>• Services are provided by start ups or the big turbine suppliers</li></ul>

# Agenda

Plural expertise

Offshore wind

Summary

Global capacity

Supply chain

North America case

**Upside scenarios and market risk**

Appendix

# Both upside scenarios and market risks in offshore wind are driven by a potential change in government interventions and Covid-19 impact

Upside scenarios and market risk

## Upside

- Governments looking to add stimulus into their economies can use clean energy infrastructure projects as a way to boost demand & jobs in their Covid-19 hit economies
  - The UK Government has highlighted Offshore Wind as a sector that can help to drive a post Covid-19 recovery and has committed to 40GW of cumulated capacity by 2030
- A Democratic led government in the United States is likely to increase funding for and change legislation in favour of decarbonisation

## Risks

- Increasing fiscal deficits due to Covid-19 could make governments less willing to subsidise offshore wind projects
- The decrease in oil and LNG price as a result of Covid-19 may make offshore wind less financially attractive compared to these non-renewable alternatives
  - This is less applicable for European countries that are highly committed to decarbonisation
- Increasing farm sizes means that # offshore wind projects in Europe is staying flat
  - Infrastructure suppliers' revenues will still be exposed to relatively high variance

# Agenda

Plural expertise

Offshore wind

- Summary

- Global capacity

- Supply chain

- North America case

- Upside scenarios and market risk

## Appendix

# Wind farm sizes are increasing, but number of new wind farm projects remains low; some sectors are project driven which can lead to high variance in revenue

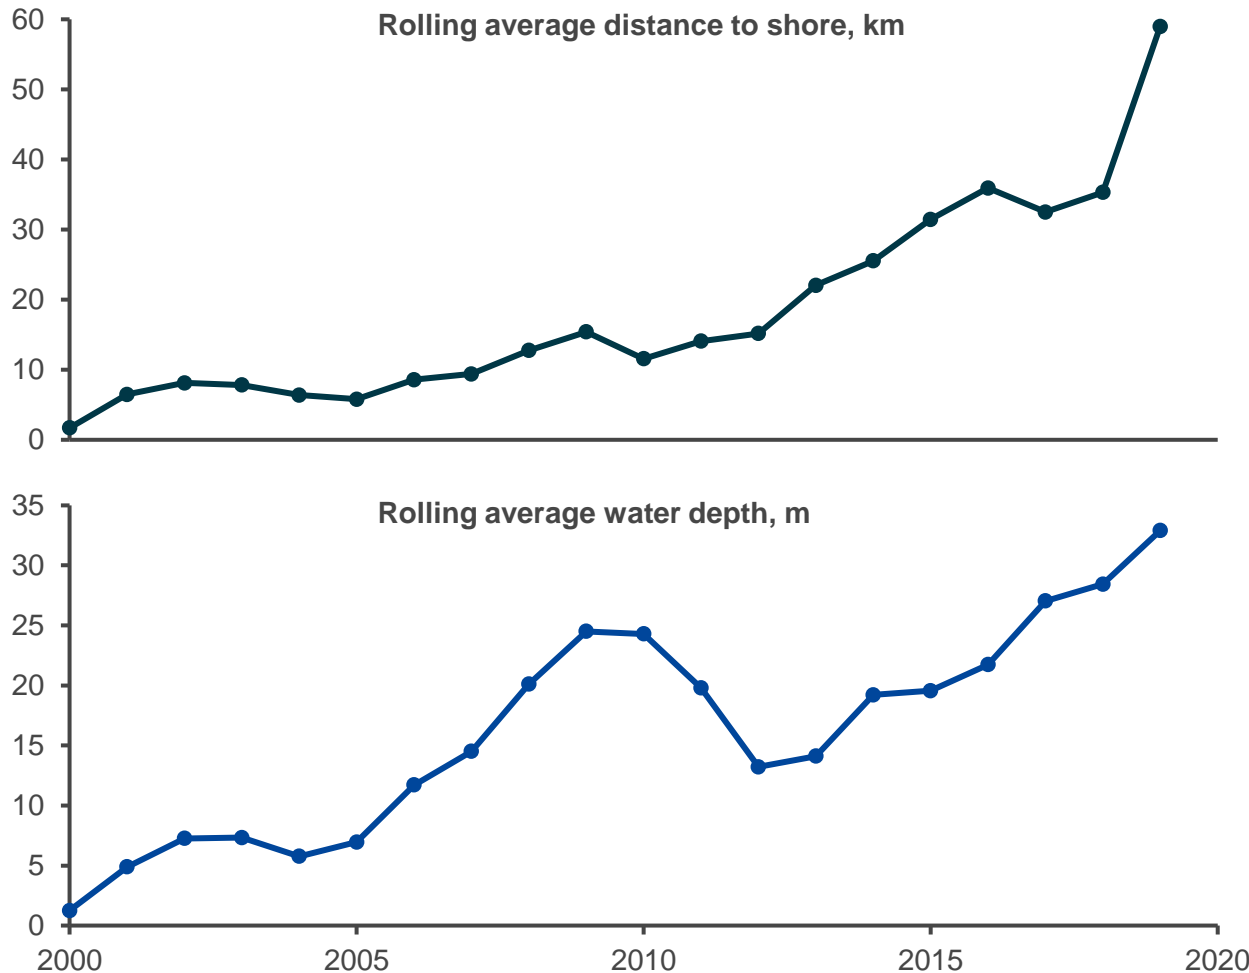

European, offshore wind number of installed wind farms and average size, MW

Source: WindEurope

# European wind farms are moving further away from the shore and into deeper waters, creating new supply chain opportunities

European offshore wind farms, rolling average water depth and distance to shore

## Commentary

- This shift enables wind developers to target more productive areas of water with a higher consistency of wind speed
- The development of floating wind turbines could accelerate this change
- Transmission infrastructure, particularly export cables, will increase in proportion of spend because of the increasing distance from the shore
- Digital monitoring equipment will become more necessary, as will the need for vessels that can withstand higher wind speeds and carry larger foundations
- Foundations will become more expensive with the transition to deeper water. Jackets are expected to be used more frequently since monopiles are currently unsuitable for use in deeper waters

# In Europe, the turbine supply sector is dominated by a handful of large players

European offshore wind supply chain map, development and turbine

Segment	Sub-segment	Example suppliers
Development	Environmental surveys	<ul style="list-style-type: none"> <li>Niras, IMARES, Fugro EMU, MMT, Gardline, Hi Def</li> </ul>
	Consenting and development services	<ul style="list-style-type: none"> <li>Typically specialised firms in country where the wind farm is installed</li> </ul>
	Engineering studies, consulting and project management	<ul style="list-style-type: none"> <li>DNV-GL, Ode, RES</li> </ul>
Turbine supply	Turbine manufacture	<ul style="list-style-type: none"> <li>GE, MHI Vestas, Senvion, Siemens</li> </ul>
	Rotor	<ul style="list-style-type: none"> <li>GE, MHI Vestas, Senvion, Siemens-Gamesa, LM Wind Power</li> </ul>
	Towers	<ul style="list-style-type: none"> <li>Ambau, CS Wind, Titan Wind Energy, Valmont SM, Windar</li> </ul>
	Drive train	<ul style="list-style-type: none"> <li>Bearings: SKF, Timken, Rothe, Erde, Schaeffler</li> <li>Gearbox: ZF, Winergy, Moventas, GE</li> </ul>
	Power conversion	<ul style="list-style-type: none"> <li>ABB, The Switch, Siemens and GE</li> </ul>
	Large fabrications	<ul style="list-style-type: none"> <li>Grup Euskal, Liebherr, Sakana, Siempelkamp</li> </ul>
